Abstract of the Disclosure

- 5 The present invention relates to a multicolored, striped, dentifrice composition comprising:
 - a. a plurality of stripe phases comprising:

10

- at least one first phase that is a translucent or transparent gel phase comprising an effective amount of colorant particles to create a striped appearance in the translucent or transparent gel phase; and
- at least one second phase;
 wherein the first phase and the second phase have contrasting colors and
 wherein all of the phases are rheologically equivalent; and
- a dentifrice dispensing means wherein the phases are in interfacial surface contact with
 the adjacent phase prior to extrusion from the dispensing means.
